## I. General Information.

Unless otherwise specified, reagents were used as obtained from the vendor without further purification. Tetrahydrofuran and diethyl ether were freshly distilled from purple Na /benzophenone ketyl. Dichloromethane, acetonitrile and toluene were dried over CaH 2 and freshly distilled prior to use. All other solvents were purified in accordance with "Purification of Laboratory Chemicals". ${ }^{1}$ Air- and moisture sensitive reactions were performed using standard Schlenk techniques under an atmosphere of nitrogen. Analytical thin layer chromatography (TLC) was performed utilizing pre-coated silica gel 60 F254 plates containing a fluorescent indicator, while preparative chromatography was performed using SilicaFlash P60 silica gel (230-400 mesh) via Still's method. ${ }^{2}$ Unless otherwise stated, the mobile phases for column chromatography were mixtures of hexanes/ethyl acetate. Columns were typically run using a gradient method, beginning with $100 \%$ hexanes and gradually increasing the polarity using ethyl acetate. Various stains were used to visualize reaction products, including $p$-anisaldehyde, $\mathrm{KMnO4}$, ceric ammonium molybdate (CAM stain) and iodine powder.
${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were obtained using Bruker-300, Varian-300, Varian Inova-500, or Varian Unity- 500 spectrometers. For ${ }^{1} \mathrm{H}$ NMR, chemical shifts are reported relative to residual protiated solvent peaks ( $\delta 7.26,2.49,7.15$ and 7.09 ppm for $\mathrm{CDCl}_{3},\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO}, \mathrm{C}_{6} \mathrm{D}_{6}$ and $\mathrm{CD}_{3} \mathrm{C}_{6} \mathrm{D}_{5}$ respectively). ${ }^{13} \mathrm{C}$ NMR spectra were measured ateither 125 MHz or 75 MHz on the same instruments noted above for recording ${ }^{1} \mathrm{H}$ NMR spectra. Chemical shifts were again reported in accordance to residual protiated solvent S3 peaks ( $\delta 77.2,39.5,128.0$ and 137.9 ppm for $\mathrm{CDCl}_{3},\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO}, \mathrm{C}_{6} \mathrm{D}_{6}$, and $\mathrm{CD}_{3} \mathrm{C}_{6} \mathrm{D}_{5}$, respectively). High-pressure liquid chromatography (HPLC) analyses were performed at 215 and 235 nm using a Shimadzu HPLC, Model LC-20AB. Further details are given in Section VIII. Accurate mass measurements were acquired at the University of Wisconsin, Madison using a Micromass LCT (electrospray ionization, time-offlight analyzer or electron impact methods). When two or more significant isotopes were present in the molecule, a monoisotopic approach was used, focusing on the isotope with the lowest mass ( 35 Cl and 79 Br ). IR spectra were obtained using a Bruker ALPHA Platinum ATR FT-IR spectrometer. The NMR and Mass Spectrometry facilities are funded by the NSF (CHE9974839, CHE-9304546, CHE-9208463, CHE-9629688) and the University of Wisconsin, as well as the NIH (RR08389-01).

This solution was stirred at $0^{\circ} \mathrm{C}$ for 30 min , warmed to $23^{\circ} \mathrm{C}$ and stirred for an additional $4-12 \mathrm{~h}$. The reaction mixture was then cooled to $0^{\circ} \mathrm{C}$, at which point the homoallenic alcohol (1 equiv) was added as a solution in $\mathrm{N}, \mathrm{N}$-dimethylacetamide ( 0.6 M ). The reaction was stirred for 1 h at $23{ }^{\circ} \mathrm{C}$ and then quenched by the addition of an equal volume of $\mathrm{H}_{2} \mathrm{O}$. The aqueous phase was extracted with three portions of EtOAc and the combined organic phases washed with five portions of $\mathrm{H}_{2} \mathrm{O}$. The combined organics were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and the solvent removed under reduced pressure. The crude material was purified via column chromatography.

## IV. Preparation of homoallenic sulfamides.

Precursor to compound 7. A dry, 50 mL round bottom flask was placed under a nitrogen atmosphere and charged with the desired alcohol ( $500 \mathrm{mg}, 2.2 \mathrm{mmol}, 1$ equiv), triphenylphosphine ( $754 \mathrm{mg}, 2.9 \mathrm{mmol}, 1.3$ equiv), and tert-butyl aminosulfonylcarbamate ( 563 $\mathrm{mg}, 2.9 \mathrm{mmol}, 1.3$ equiv) were combined in dry THF ( $8.5 \mathrm{~mL}, 0.3 \mathrm{M}$ ) and cooled to $0{ }^{\circ} \mathrm{C}$. Diisopropyldicarboxylate ( $0.57 \mathrm{~mL}, 2.9 \mathrm{mmol}$. 1.3 equiv) was added in a dropwise fashion to the resulting solution. The reaction mixture was warmed to room temperature and stirred for 4 h

The crude product was purified via column chromatography ( $0 \% \mathrm{EtOAc} /$ hexanes to $25 \% \mathrm{EtOAc} /$ hexanes, gradient) to yield pure homoallenic sulfamide ( $677 \mathrm{mg}, 1.7 \mathrm{mmol}$ ) as a white solid in a yield of $76 \%$. ${ }^{1} \mathrm{H}$ NMR ( 500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 5.25(\mathrm{~s}, 2 \mathrm{H}), 4.85(\mathrm{tt}, J=6.7,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.74(\mathrm{ddd}, J=8.7,7.3,1.3 \mathrm{~Hz}, 2 \mathrm{H})$, $2.34-2.19(\mathrm{~m}, 2 \mathrm{H}), 1.97-1.89(\mathrm{~m}, 2 \mathrm{H}), 1.53(\mathrm{~s}, 9 \mathrm{H}), 1.43-1.28(\mathrm{~m}, 6 \mathrm{H}), 0.94-0.86(\mathrm{~m}, 3 \mathrm{H})$, 0.09 (s, 9H). ${ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 206.13,152.45,93.14,86.58,84.35,47.60,31.62$, $29.51,29.10,28.45,28.27,22.66,14.20,-1.42$. ## V. Preparation of cycloalkynes.

General procedure. The following procedure was adapted from our previously reported syntheses of endocyclic bicyclic methyleneaziridines. ${ }^{3}$ The homoallenic sulfamate ( 1 equiv) and $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ ( 0.05 equiv) were placed in a dry round bottom flask. The solids were dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to prepare a 0.2 M solution and stirred for 5 min at rt . PhIO ( 1.2 equiv) was added in a single portion and the reaction mixture was stirred for 30 min while monitoring by TLC. When TLC indicated complete consumption of the starting material, 1 M TBAF in THF (2 equiv) was added. After 5 min at rt , the reaction was checked for completion by TLC. The reaction was then quenched by the addition of an equal volume of water and extracted with 3 portions of EtOAc. The combined organics were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtered. The solvent was removed under reduced pressure and the crude product purified by column chromatography.

Compound 5. The cyclic alkyne was prepared from the corresponding homoallenic sulfamate $(1.3 \mathrm{~g}, 4.3 \mathrm{mmol})$. Purification by column chromatography ( $0 \% \mathrm{EtOAc} /$ hexanes to $15 \%$ EtOAc/hexanes, gradient) furnished pure $5(0.90 \mathrm{~g}, 3.9 \mathrm{mmol})$ as a white solid in a yield of $89 \%$. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 5.10(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.92(\mathrm{ddd}, J=10.6,10.5,4.2 \mathrm{~Hz}, 1 \mathrm{H})$, 4.66 (ddd, $J=11.0,5.3,3.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.23$ (dtd, $J=8.8,6.8,3.5 \mathrm{~Hz}, 1 \mathrm{H}$ ), 2.75 (dddd, $J=17.7$, $10.1,5.3,2.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.41$ (ddt, $J=17.0,4.6,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.77-1.59(\mathrm{~m}, 2 \mathrm{H}), 1.44-1.26(\mathrm{~m}$, $6 \mathrm{H}), 0.89(\mathrm{t}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 97.38,96.84,76.47,49.62,32.80$, 31.23, 25.63, 22.55, 21.87, 14.06. HRMS (ESI) $m / z$ calculated for $\mathrm{C}_{10} \mathrm{H}_{21} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{~S}\left[\mathrm{M}+\mathrm{NH}_{4}{ }^{+}\right]$ 249.1267; found, 249.1265.

Compound 6. Compound $5(0.25 \mathrm{~g}, 1.1 \mathrm{mmol})$ was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.2 \mathrm{M})$. To this solution was added di-tert-butyl dicarbonate $(0.35 \mathrm{~g}, 1.6 \mathrm{mmol})$ and triethylamine $(0.23 \mathrm{~mL}, 1.6$ mmol ), followed by 4-dimethylaminopyridine ( $13 \mathrm{mg}, 0.11 \mathrm{mmol}$ ). The reaction was stirred at ambient temperature under a $\mathrm{N}_{2}$ atmosphere until TLC indicated complete consumption of 5 . The reaction mixture was quenched by the addition of an equal volume of saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$. The aqueous phase was extracted with $3 \times 10 \mathrm{~mL}$ portions of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the combined organic phases dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solution was filtered and the volatiles removed under reduced pressure. The crude product was purified via column chromatography ( $0 \%$ $\mathrm{EtOAc} / \mathrm{hexanes}$ to $25 \% \mathrm{EtOAc} / \mathrm{hexanes}$, gradient) to yield pure cyclic alkyne $\mathbf{6}(0.28 \mathrm{~g}, 0.84$ mmol ) as a white solid in $76 \%$ yield. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 5.06(\mathrm{ddd}, J=12.4,11.1$, $4.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.97(\mathrm{td}, J=8.0,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.62(\mathrm{dd}, J=11.1,6.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.92(\mathrm{dddd}, J=17.1$, $12.4,6.1,2.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.30(\mathrm{dd}, J=17.1,3.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.04-1.89(\mathrm{~m}, 2 \mathrm{H}), 1.54(\mathrm{~s}, 9 \mathrm{H}), 1.40-$ $1.28(\mathrm{~m}, 6 \mathrm{H}), 0.89(\mathrm{td}, J=6.8,5.7,3.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 152.01,96.15$, 94.46, 85.29, 75.03, 55.61, 33.48, 31.15, 28.51, 26.00, 22.61, 21.72, 14.09. ## X. Kinetic data for the reactions of 5-8 with benzyl azide.

General Procedure. A stock solution of cycloalkyne $(0.02 \mathrm{M})$ and a stock solution of benzyl azide and mesitylene ( 0.02 M with respect to both solutes) were combined in equal volumes in a small cuvette, then rapidly mixed. The resulting solution was transferred to an NMR tube and the reaction progress was monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ at $25^{\circ} \mathrm{C}$, with spectra taken once every 15 min over the course of several hours. The $k_{2}$ values were determined by measuring the decrease in cycloalkyne signal integrations which were standardized relative to the mesitylene standard. Inverse concentration of cycloalkyne was plotted against time, and the points were fitted by linear regression. The slope of the resulting line corresponded to the $k_{2}$ value. Each experiment was run in triplicate and the $k_{2}$ values for each trial were averaged.

## XV. Bioconjugation Studies.

Compound 18. Cyclic alkyne 18 was prepared from the corresponding homoallenic sulfamate ( $300 \mathrm{mg}, 0.79 \mathrm{mmol}$ ) following the general procedure from Section V. The general procedure was adapted to use 1 equiv of 1 M TBAF in THF to minimize deprotection of the tethered alcohol in addition to the desilylation and ring expansion process. The crude product was purified via column chromatography ( $0 \% \mathrm{EtOAc} / \mathrm{hexanes}$ to $20 \% \mathrm{EtOAc} / \mathrm{hexanes}$, gradient) to yield pure alkyne ( $69 \mathrm{mg}, 0.29 \mathrm{mmol}$ ) as a white solid in $29 \%$ yield. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 5.61(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.94(\mathrm{td}, J=10.9,4.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.64(\mathrm{ddd}, J=11.0,5.5,2.4$ $\mathrm{Hz}, 1 \mathrm{H}), 4.29(\mathrm{dtt}, J=6.7,4.3,2.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.79-3.62(\mathrm{~m}, 2 \mathrm{H}), 2.81$ (dddd, $J=16.9,10.7,5.4$, $2.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.38(\mathrm{ddt}, J=16.9,4.3,2.2 \mathrm{~Hz}, 1 \mathrm{H}), 0.91(\mathrm{~s}, 8 \mathrm{H}), 0.10(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$

Compound 19. Compound 18 ( $20 \mathrm{mg}, 0.066 \mathrm{mmol}$ ) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.3 \mathrm{M})$. To this solution was added sodium hydroxide $(4.2 \mathrm{mg}, 0.10 \mathrm{mmol})$, and benzyltriethylammonium chloride ( $1.5 \mathrm{mg}, 0.007 \mathrm{mmol}$ ). The suspension was stirred cooled to $0{ }^{\circ} \mathrm{C}$ under a $\mathrm{N}_{2}$ atmosphere at which point 3-maleimidopropropionyl chloride ( $14 \mathrm{mg}, 0.075 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 0.6 M ) was added dropwise. The reaction was stirred at $0{ }^{\circ} \mathrm{C}$ until TLC indicated complete consumption of starting materials. The solution was diluted with an equal volume of hexanes, then filtered through a small celite pad. Filtrate was concentrated via rotary evaporation. The crude product was purified via column chromatography ( $0 \% \mathrm{EtOAc} / \mathrm{hexanes}$ to $25 \%$ EtOAc/hexanes, gradient) to yield pure alkyne $18(17 \mathrm{mg}, 0.036 \mathrm{mmol})$ as a white solid in $55 \%$ yield. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 6.71(\mathrm{~s}, 2 \mathrm{H}), 5.62(\mathrm{td}, J=7.4,2.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.05(\mathrm{ddd}, J=$ $12.4,11.0,4.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 4.67 (dd, $J=11.1,6.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.99-3.88$ (m, 3H), 3.83 (ddd, $J=$ $14.3,8.9,5.6 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.29 (ddd, $J=17.6,8.9,5.9 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.08 (ddd, $J=17.6,8.9,5.6 \mathrm{~Hz}$, 1 H ), 2.95 (dddd, $J=17.2,12.4,6.2,3.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 2.34 (dd, $J=17.2,4.0 \mathrm{~Hz}, 1 \mathrm{H}), 0.88$ (s, 9H), $0.07(\mathrm{~d}, J=1.3 \mathrm{~Hz}, 6 \mathrm{H}){ }^{13}{ }^{1} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.92,170.50,134.40,94.59$, 94.41, $75.85,63.14,52.59,36.13,33.94,25.91,21.85,18.34,1.17,0.15,-5.19$. Semisynthesis of RNase 1 conjugates. DNA fragment encoding human P19C RNase 1 was inserted into the pET22b expression vector from Addgene (Cambridge, MA) for tagless expression in Escherichia coli strain BL21(DE3). The production and purification of P19C RNase 1 was performed as described previously. ${ }^{5}$ A SNO-OCT-RNase 1 conjugate was prepared by reaction of P19C RNase 1 with 15 -fold molar excess of SNO-OCT 19 in 0.10 M Tris- HCl buffer, pH 8.0 , containing DMSO ( $5 \% \mathrm{v} / \mathrm{v}$ ) for 3 h at ambient temperature. Purification using a HiTrap SP HP cation-exchange column (GE Healthcare, Chicago, IL) afforded the desired conjugate. Next, a biotin-RNase 1 conjugate was prepared by reaction of SNO-OCTRNase 1 with a 5-fold molar excess of azide-PEG3-biotin (Sigma-Aldrich, St. Louis, MO) in phosphate-buffered saline containing DMSO ( $5 \% \mathrm{v} / \mathrm{v}$ ) for 2 h at ambient temperature. Purification using monomeric avidin agarose (Pierce, Waltham, MA) afforded the desired conjugate. The molecular mass of each protein conjugate was confirmed by MALDI-TOF mass spectrometry using a Voyager instrument (Applied Biosystems).

## XVI. Computational details.

Optimizations were performed with Gaussian 09 software ${ }^{6}$ at the M06-2X level of theory ${ }^{7}$ and the $6-311+G(d, p)$ basis set. M06-2X has been shown to describe trends in reactivity accurately for cycloadditions. ${ }^{8}$ Optimizations were performed utilizing IEFPCM dielectric continuum solvent model for water with UFF radii. ${ }^{9}$ Frequency calculations were performed to confirm stationary points as minima or first-order saddle points. All $\Delta E$ and $\Delta E^{\ddagger}$ values include zeropoint corrections.

Figure S3. Energies and free energies of activation ( $\mathrm{kcal} / \mathrm{mol}, 298 \mathrm{~K}$ ) for the lowest energy TSs for cycloadditions methyl azide to alkynes 13b and 13j. Favorable electronics as a result of the Boc group are outweighed by increased rigidity and a higher $\Delta S^{\ddagger}$. Geometries optimized at the M06-2X/6-311+G(d,p) level of theory using an IEFPCM solvent model for water (radii = UFF).

Figure S4. Free energies of activation ( $\mathrm{kcal} / \mathrm{mol}, 298 \mathrm{~K}$ ) for the lowest energy TSs for each regioisomeric cycloaddition of diazo- and azidoacetamide to alkyne 13b. Geometries optimized at the M06-2X/6-311+G(d,p) level of theory using an IEFPCM solvent model for water (radii = $\mathrm{UFF}) . \varphi$ is the dihedral angle around the acetylenic $\mathrm{C}-\mathrm{C}$ bonds ( $\mathrm{CC}-\mathrm{C} \equiv \mathrm{C}$ and $\mathrm{C} \equiv \mathrm{C}-\mathrm{CN}$ ).
